Cross-sectional imaging is usually used to refer to CT, MRI, PET, and SPECT and related imaging techniques, that view the body in cross-section i.e. as axial (cross-sectional) slices.. Ultrasonography is sometimes included under this umbrella term, especially with reference to echocardiography, which produces standardized axial slices through the heart.

Computed tomography (CT), earlier referred to as computed axial tomography (CAT), is another non-invasive imaging procedure.CT works by using x-rays too but the machine is more advanced. It rotates around a stationary person creating multiple cross-sectional images, which can then be rendered into a 3D image.

First published in 1991, Human Sectional Anatomy set new standards for the quality of cadaver sections and accompanying radiological images. Now in its fourth edition, this unsurpassed quality remains and is further enhanced by the addition of new material. The superb full-colour cadaver sections are compared with CT and MRI images, with accompanying, labelled, line diagrams. Many of the ...
