crystals actually grow inside the glaze while it is still very hot (about 2100° F). The crystals start out as microscopic spots in the glaze, called "seeds." These seeds form spontaneously in the glaze, in random numbers and locations. The glaze is

Crystalline Glazes - jonpriceceramics.com

Crystalline glazes have high thermal expansion and craze, crazed glazes are not considered functional and they severely weaken fired ware. Also, because crystalline glazes have high melt fluidity they will run downward on the inside functional surfaces of ware forming a pool at the base. The thermal expansion of the thick glass mass will almost certainly be higher than the body, it will thus have the power to impose its cracks onward into the body matrix.
