Evolution And

Speciation Study

Speciation refers to the creation of a new species. Through this process, the earliest groups of similar organisms were able to branch out and populate the world with millions of different varieties of life. Though vital to the concept of evolution, the term "species" has been defined several different ways throughout history.

Over the last two decades, the study of speciation has expanded from a modest backwater of evolutionary biology into a large and vigorous discipline.

Thus, the literature on

lineage-splitting event resulting in two or more separate species.

Causes: Evolution is caused by mutation, gene flow, nonrandom mating, genetic drift and natural selection.

Speciation is caused by geographical isolation, natural selection, adaptive radiation that ultimately lead to reproductive isolation.
