### **I Mammal Why Your Brain**

Mammals seek dominance because it stimulates their happy chemicals. An appetite for status develops as naturally as the appetite for food and sex. Status hierarchies emerge spontaneously as each individual strives to meet their needs and avoid harm. You would never think this way in words, but your mammal brain uses neurochemicals instead of words.

The mammal brain rewards you with the good feeling of serotonin when you gain a position of strength. But the serotonin is soon metabolized and you have to do more to get more. This is why people are so busy seeking social power. Serotonin is not aggression. It's the calm pleasure of knowing you can meet your needs.

Mammals live in groups for protection from predators, but group life can be frustrating. Some herd mates always seem to get the best mating opportunities and foraging spots. Fortunately, the mammal brain evolved to handle this. It releases stress chemicals when a mammal needs to hold back to avoid conflict.

February 5, 2013. Scientists have wondered for decades why mammals' brains are so large relative to their body size, but for the most part all they could do was guess. The fossils that could give paleontologists clues to the earliest development of the mammalian brain are hard to come by, and the in-depth study that would offer better clues meant destroying 190 million-year-old fossils from China.

### **Professor Asks, "Why Do Mammals Have Big Brains?"**

This part of the brain is unique to mammals. According to MacLean (1990), the limbic system of this mammalian brain is the center of emotion and learning. It developed very early in mammalian evolution to regulate the motivations and emotions that we now associate with feeding,

Thrashing the measly 1.2kg human brain are the following species: dolphins at 1.5-1.7kg, elephants and blue whales at 5kg and killer whales at roughly 6kg. But, the biggest brain of them all is the sperm whale's, weighing a mighty 7kg. Many dispute the relevance of this, arguing that a brain-to-body mass ratio is more informative of intellect.

This is why we're often disappointed by the same-old thing, and why we're always seeking. Natural selection built a brain that rewards you for meeting survival needs, not for just sitting around. Survival is defined in a quirky way, alas: your mammal brain cares about the survival of your genes, and it relies on neural pathways built in youth.

The brain of the elephant is the largest contained by any living land-dwelling mammal. The adult male elephant's brain can grow to be a whopping 12 pounds. As with the sperm whale, the brain accounts for relatively little of the elephant's total body mass. The elephant's brain accounts for roughly .1 percent of its mass, and is uniquely located ...

The brain is a mass of soft, spongy, pinkish gray nerve tissue that weighs about 1.2 kg in a human being. It is connected at its base with the spinal cord, which is also part of the central nervous system. Called also encephalon. (See also color plates.) The brain is made up of billions of nerve cells, intricately connected with each other.

The Latin word for arc or girdle is "limbus", and this brain is called the "limbic system". We humans share this brain with older mammals like dogs, cats, and horses, and even mice (as opposed to newer mammals like chimps; we'll get to them in a moment). Their brains, and this part of our brains, are extremely similar.

The Inner Mammal Method I accept my mammal brain. My brain evolved to promote survival, not to make me happy. My happy chemicals are designed to do a job, not to flow all the time for no reason.

### **The Inner Mammal Method - The Inner Mammal Institute**

Theories of the evolution of mammalian brain size link brain volume to body mass either through body surface area or through basal metabolic rate. The surface area hypothesis requires that the slope of the line relating brain volume to body mass is 2/3; the metabolic rate hypothesis predicts that the slope of brain volume against body mass will be 3/4, owing to the relationships of basal metabolic rate to body and brain size.
