In archaeology, lithic technology includes a broad array of techniques used to produce usable tools from various types of stone. The earliest stone tools were recovered from modern Ethiopia and were dated to between two-million and three-million years old. The archaeological record of lithic technology is divided into three major time periods: the Paleolithic (Old Stone Age), Mesolithic (Middle Stone Age), and Neolithic (New Stone Age).

Although lithic raw material data suggest that Kirk groups were highly mobile (e.g., see this paper) the area of the "horizon" is much too large for it to be the product of a single group of people: the hunter-gatherers discarding Kirk points in Ontario are not the same individuals as those discarding Kirk points in Florida.

As the Ivane occupants became familiar with the range of lithic resources available both within and outside the Ivane valley, we may, therefore, see changes in raw material selection, as different types of raw materials are located, tested and practised with, and found suitable or unsuitable for particular tasks.

The study of the raw materials includes the macroscopic assignation of the remains to some of the basic lithic categories (quartzite, quartz, and chert/flint) and has focused specifically on the non-detritic fine-grained siliceous varieties (chert, radiolarite and flint) for two main reasons: they are the most common types in the two sites (especially in El Espertín) and the largest number of previous studies has been performed on those types of rocks.

In the Shetland islands off the north coast of Scotland there was major exploitation of a lithic source known as riebeckite felsite during the Neolithic period. This source provided the raw material for the majority of stone axes known from the archipelago and also for objects known as Shetland knives.

Traditional Knowledge and Lithic Resources

A variety of lithic materials, the raw resources of which stone crafts and tools were made, were locally available in the Black Warrior Valley. However, raw materials of a higher physical quality, as well as an apparently higher cultural value, were of a non-local origin and were therefore limited in their circulation.

where exposures of lithic material are non-existent, prehistoric people developed strategies that mini-mized the cost of acquisition and the risk of procure-ment failure by importing finished or near-finished tools, scavenging discarded tools, recycling worn or broken tools, and practicing raw-material conserva-tion (Austin 1997).

Lithic Raw Materials. Stone was an important resource for the prehistoric occupants of the Bosque River valley. Not only did the inhabitants require knappable material, such as chert, for their tools and weapons, they also used stone for their hearths and for intensive cooking of certain plant foods in oven-like features.

The collection contains two research components: 1) An organized display of each raw material sample, and 2) Bulk samples of most materials for additional experimentation. With over 1,300 raw material types, this comprehensive collection enables research into raw material sourcing, heat treating, experimental replication, and use-wear studies.

From these lithic materials, a great deal of information can be culled. The sources of raw materials tell us about procurement and exchange patterns. The nature of the materials and their finished products tell us about technology, skill, and shared learning. Some of the artifacts can also be dated, providing us with more precise chronologies.
