A signal is classified as random if it takes on values by chance according to some probabilistic model. You can extend the deterministic sinusoid model to a random model by making one or more of the parameters random. By introducing random parameters, you can more realistically model real-world signals.

Deterministic and Random Signal Classifications - dummies

In signal processing applications, it is the probabilistic description of the random variable, rather than the statistical characterization of events in the sample space, that is generally of interest. It is therefore more convenient to have a probability law assigned to the random variable itself.
