The first chapters of this textbook review some simple mathematics used in the physics of radiation therapy and the methods for producing x-rays. The units of dose in radiation are described, and it is shown how these units are applied to x-ray therapy and in treatment planning. The same kind of background information is given for radioactivity and

They originate from the annihilation of positrons and electrons within the target. They were produced by the slowing down of electrons as they bend around the strong charge of the target nuclei. They are the characteristic photon energy of the target material when placed in a strong magnetic field.

Radiation therapy kills cancer cells that are dividing, but it also affects dividing cells of normal tissues. The damage to normal cells causes unwanted side effects. Radiation therapy is always a balance between destroying the cancer cells and minimizing damage to the normal cells. Radiation doesn't always kill cancer cells or normal cells right away.
